

Womack's Wombats CSCI-3308 Project Milestone 2

Trello Board: <https://trello.com/b/SjEkaJvM/csci-3308>

Sprints:

- We plan on having 10 sprints: The first few sprints will be as follows:
 1. Setting up a database and a development environment using Docker, Git, Heroku, and Django. This will require all members of the team becoming familiar with these tools and setting up their personal machines for development.
 2. Get the website set up to enter a list of ingredients into a search box.
 3. Once a set of search terms is entered be returned a list of recipes
 4. Refine ranking outputs to give a list that's ordered by how close user list of ingredients is to the list of recipes ingredients
 5. Refine the output of the built algorithm to match the user interface design ideas: get one recipe at a time and giving the option of accepting and rejecting.
 6. potential for more refinement and rounding out of errors.

Agile Scrum Meeting:

We are still in the early stages of the project, so not much has been accomplished thus far, everyone stated the same to-dos which are just to get familiar with the tools we will be using and take the weekend to get their personal computers set up for development.
